Grid Scheduling Dictionary of Terms and Keywords

Status of This Memo

This memo provides information to the Grid community regarding a dictionary for Grid Scheduling. Distribution is unlimited.

Copyright Notice

Abstract

The GGF Scheduling and Resource Management Area is concerned with various issues relating to resource scheduling and resource management in Grid environments. In examining current scheduling systems, it became apparent that a dictionary of terms and keywords would assist in discussions. This information could then be used to develop a Grid language that would provide seamless communication and advance reservation capabilities to the various schedulers in use within a Grid.

1. General Remarks

The dictionary is focusing on scheduling in a Grid environment; it does not address scheduling terms in general. The terms are used in the manner typically found in Grid schedulers. The authors are aware that there may be multiple definitions of some terms depending e.g. on the environment where a term is used.

A context is given for each term indicating where a term usually is employed. If a term appears in several contexts, the most relevant ones are listed together with the term.

The following contexts are used:

- Access
- Application
- Network
- Process
- Resource
- Resource Management
- Scheduler

2. List of Terms and Definitions

Term	Context	Definition	
Account	Access	The permissions for a particular user to use various resources.	
Authentication	Access	The process by which one entity verifies the identity of another.	
User	Access	A person authorized to submit jobs to <i>High Performance Computing</i> resources.	
Application Software	Application	The actual programs used by an application.	
Checkpoint	Application	Saving the current state of a program and its data (including intermediate results) to disk or other non-volatile storage, so that if interrupted the program could be restarted at the point at which the last Checkpoint occurred. This is a feature provided by some schedulers, but not all.	
Fork	Application, Resource Management, Scheduler	Making a copy of a process for execution.	
Preemption	Application	Preemption of individual threads or the entire job during the execution of the job (and potential relocation).	
Re-runable	Application	If a <i>Batch Job</i> can be terminated and its execution restarted from the beginning without harmful side effects, then the job is said to be Re-runable.	
Bandwidth	Network	Bandwidth is a property of the network hardware (the transmission medium), higher Bandwidth allows theoretically more data to be transmitted per time unit (unit is bit per second). The achievable <i>Data Rate</i> depends on and is limited by the Bandwidth. <i>QoS</i> parameter.	
Data Rate	Network	The Data Rate defines the amount of data which can be transmitted per time unit via a transmission medium from one application to another (unit is bit per second). QoS parameter.	
Delay	Network	A Delay or latency is the time interval between sending and receiving a signal (unit is second; the ITU recommends a delay < 100ms in WANs). QoS parameter.	

LID A LI	L		
IP Address	Network, Resource	Internet Protocol Address. Every system within a network using TCP/IP (Transmission Control Protocol/Internet Protocol, also called Internet protocol family) has an unambiguous IP address assigned.	
Jitter	Network	Phase distortion, changing the signal frequency. Jitter occurs especially at high frequencies and may result in loss of data. QoS parameter.	
LDAP	Network	Lightweight Directory Access Protocol.	
Packet Size	Network	Size of a data packet (unit is bit). A data packet is a well defined order of characters which are treated as a unit. QoS parameter.	
Port Number	Network, Resource	Port Numbers are used for data transfer between the transport protocol layer and the application process. Also ranges of port numbers can be scheduled.	
Protocol	Network	A protocol is a complete and unambiguous set of rules (formats, their semantics & syntax, parameters, timing, error handling,) defining the communication between two or more entities	
QoS	Network, Resource	Quality of Service (QoS) refers to the performance attributes of an end-to-end connection (like a TCP/IP network connection); Covered QoS parameters are <i>Bandwidth</i> , <i>Data Rate</i> , <i>Delay</i> , <i>Jitter</i> and <i>Packet Size</i> .	
Application	Process	A combination of program tasks and data manipulations that make use of computing resources.	
Batch Job	Process	A Batch Job is submitted to a <i>Batch System</i> and is processed without any further interaction from the <i>User</i> (except for status changes like <i>Cancel</i> , <i>Hold</i> ,)	
Cancel	Process	Or <i>Delete</i> . Executing this action on a job results in the job being removed from the system. On a <i>Batch System</i> this is analogous to removing the job from the <i>Queue</i> .	
Collaborative Computing	Process	To work jointly with other computing devices.	
Delete	Process	Or <i>Cancel</i> . Executing this action on a job results in the job being removed from the system. On a <i>Batch System</i> this is equivalent to removing the job from the <i>Queue</i> .	
Hold	Process	If a job is waiting in a queue for execution the action Hold prevents the job from being scheduled. Performing a <i>Release</i> allows the held job to be scheduled again. <i>PBS</i> also enables holding running jobs which is equivalent to <i>Suspend</i> .	
Interactive Job	Process	A <i>Job</i> whose input and output are interleaved, allowing the user's input to depend on earlier output from the same run.	
Job	Process	An application or task performed on <i>High Performance Computer</i> resources. A Job may be composed of steps/sections as individual schedulable entities.	
Release	Process	Allows a held job to be scheduled again (see <i>Hold</i>).	
Resume	Process	A Resume action can be performed on a <i>Suspended</i> job. The job execution is restarted.	
Suspend	Process	The current job status is stored, resources are released and the execution of the job is interrupted. A Suspended job can be <i>Resumed</i> .	
Task	Process	A specific piece of work required to be done as part of a job or application.	

_			
Cluster	Resource	A set of execution "servers" or hosts on which a single <i>Batch Server</i> manages <i>Batch Jobs</i> . A cluster may be made up of a set of workstations, multiple <i>CPU</i> systems, or a set of nodes in a parallel system.	
Computational Grid	Resource	Large-scale high performance distributed computing environments that provide access to high-end computational resources.	
CPU	Resource	Central Processing Unit - the part of a computer system that operates on information or data. Some schedulers require a specification of how many CPUs are available on a node.	
Disk	Resource	A non-volatile device that is used to store information and that provides read/write access.	
HPC	Resource	High Performance Computing - The technology that is used to provide solutions to problems that: • require significant computational power • either need to access, or process, very large amounts of data quickly • need to operate interactively across a geographically distributed network	
HPSS	Resource	High Performance Storage System.	
Load	Resource	The quantity of resources required for a job to run.	
Memory	Resource	The capacity for storing information during the lifetime of a program.	
Name Space	Resource, Resource Management	Name Spaces provide (locally) unique names for (a hierarchy of) objects (e.g. resources, services, applications). The information is often organized in a tree structure and accessible through directory services. A global Name Space aims to unify multiple or conflicting naming schemes allowing to use the same name across an entire <i>Grid</i> .	
Node	Resource	A point of connection on a network. Some schedulers require a job to specify how many Nodes it requires. A Node consists of one or more Central Processing Units (CPUs). Each processor may have multiple threads running on it that share code and data but have different stacks.	
Processor	Resource	The part of a computer which performs the manipulation of data from one state to another.	
Queue	Resource	A collection of schedulable entities, e.g. jobs (or job-related tasks) within the (batch) queuing system. Each Queue has a set of associated attributes that determine which actions are to be performed upon each job within the Queue. Typical attributes include queue name, queue priority, resource limits, destination(s), and job count limits. Selection and scheduling of jobs are implementation-defined. The use of the term "queue" does not imply the ordering is "first in, first out."	
Visualization	Resource	A device that displays data in picture form. The most basic Visualization is that of turning transaction data and summary information into charts and graphs.	
Advance Reservation	Resource Management	Advance reservation is the process of negotiating the (possibly limited or restricted) delegation of particular resource capabilities over a defined time interval from the resource owner to the requester.	
Allocation	Resource Management	The quantity of resources required by a job or reserved for a job.	

Drokor	Donource	A process which performs resource queting (producer) or
Broker	Resource Management	A process which performs resource quoting (producer) or resource discovery (consumer) and selection based on various strategies, assigns application task(s) to those resources, and distributes data or co-locates data and computations. <i>Cost Models</i> may be used for negotiations before selecting/requesting resources.
Co-Allocation	Resource Management	Ensures that a given set of resources is available for use simultaneously.
Condor	Resource Management	A computing environment that makes use of and manages very large collections of distributed, private workstations.
Condor-G	Resource Management	A version of <i>Condor</i> that works with <i>Globus</i> .
Co-Scheduling	Resource Management	The ability to schedule various resources for a given time or for a series of sequential times (supported by <i>Co-Allocation</i>).
Cost Model	Resource Management	Defines the cost-benefit ratio of a resource, determines supply and demand. Cost Models exist for both producers and consumers.
CPU Time	Resource Management	The amount of time a process takes to run assuming that it has exclusive and uninterrupted use of the <i>CPU</i> . In praxis this means adding up all the small amounts of time the CPU actually works on the process.
Data Co- Location	Resource Management	For task-parallel programs, computations or data may reside in distinct locations, and the scheduler must determine which need to be moved.
Data Distribution	Resource Management	For data-parallel programs, all computational resources execute the same program, and the complexity of the scheduling process lies in the determination of a performance-efficient distribution or decomposition of data.
Duration	Resource Management	A specification of how long a job is expected to run.
End Time	Resource Management	A specification of the time when a job is expected to quit running or actually quit running. May be specified as an actual time or as an offset from the current system time.
Execution Time	Resource Management	Difference between End Time and Start Time.
Fair Share	Resource Management	A Scheduling Policy that ensures each user or group of users receives a configurable share of (computing) resources over a configurable period of time called "history hours". The priority of each job is based on a dynamic calculation based on weighted usage of one or more resources during the history hours for the user/group. A decay factor is applied so recently used time weights more heavily than the time used in the distant past.
Globus Project	Resource Management	Software tools that make it easier to build computational <i>Grids</i> and grid-based applications.
GLUnix	Resource Management, Scheduler	GLUnix is a scheduling and resource management system. It supports <i>Batch</i> and <i>Interactive Jobs</i> and performs execution time <i>Load Balancing</i> .
GRD	Resource Management, Scheduler	The Global Resource Director is a scheduling and resource management system.
Grid	Resource Management	Grids are persistent environments that enable software applications to integrate instruments, displays, computational and information resources that are managed by diverse organizations in widespread locations.

·	•		
Legion	Resource Management	Builds system components on a distributed object-oriented model and provides a uniform programming model.	
Migration	Resource Management	Migration describes the rearrangement of allocated resources within a resource pool.	
Nimrod-G	Resource	Nimrod-G is a Grid resource <i>Broker</i> for the management and	
INITITIOU-G	Management	scheduling of task farming applications on the Grid based on	
	Iviariagement	users' QoS requirements such as deadline and budget	
		constraints and dynamically leases services at runtime	
		depending on their quality, cost, and availability.	
Pexec	Resource	Pexec is an executable and a support library for simplifying the	
I GAGC	Management	implementation and execution of SPMD programs in a Beowulf	
	Management	environment. It is build on the top of the Parallel Virtual Machine	
		(PVM).	
POE	Resource	Parallel Operation Environment – POE manages the execution	
	Management	of parallel applications across multiple nodes including the	
		communication between the nodes.	
Prun	Resource	Prun is used to launch parallel processes on a Cluster, e.g. MPI	
-	Management	applications.	
Reservation	Resource	The act of specifying a resource, a Start Time and an End Time.	
	Management		
Resource	Resource	The process of locating a set of resources on which to schedule	
Discovery	Management	the task(s) of an application.	
Resource	Resource	Bidding of resources together with costs. May be mediated	
Quotes	Management	through a <i>Broker</i> .	
Resource	Resource	The process of selecting candidate resources from a pool.	
Selection	Management		
Start Time	Resource	A specification of the time when a job is expected to run or	
	Management	actually began running. May be specified as an actual time or	
T:	December	as an offset from the current system time.	
Time	Resource	Usually refers to Execution Time of a job.	
UNICORE	Management Resource	LINICODE (LINiform Interface to COmputing DEscursos)	
UNICORE		UNICORE (UNiform Interface to COmputing REsources)	
	Management	provides a science and engineering <i>Grid</i> combining resources of	
		supercomputer centers and making them available through the Internet.	
Usage	Resource	A measurement of the compute resources accessed by a user.	
Juge	Management	This is typically a combination of <i>Nodes</i> and execution time.	
Wallclock	Resource	The elapsed time between when a process starts to run and	
Time	Management	when it is finished. The Wallclock Time is normally longer than	
11110	Wanagement	the CPU Time due to time-sharing CPUs and I/O.	
Application	Scheduler	An assignment of tasks, data, and communication to resources,	
Schedule		ordered in time – based on the rules of the Scheduling Policy,	
		and evaluated as "performance efficient" under the criteria	
		established by the performance model.	
Batch	Scheduler	A group of jobs (as programs) which are submitted for	
		processing on a computer and the results of which are obtained	
		at a later time.	
Batch	Scheduler	The capability of running jobs outside the interactive login	
Processing		session and providing for additional control over job scheduling	
		and resource contention.

Resource Resource Rom/runs. A persistent subsystem (daemon) upon a single host that provides Batch Processing capability. A set of Batch Servers that are configured for processing. The Resource system may consist of multiple hosts, each with multiple servers. EASY Scheduler Scheduler EASY (Extensible Argonne Scheduling System) was originally written to enable parallel jobs to be scheduled efficiently on IBM SP2 systems, however, various versions supporting other systems are now available. EASY-LL is an API that can combine LoadLeveler and EASY.	Batch Queue	Scheduler,	An execution queue where the request actually is started
Resource provides Batch Processing capability. A set of Batch Servers that are configured for processing. The system may consist of multiple hosts, each with multiple servers. EASY Scheduler EASY (Extensible Argonne Scheduling System) was originally written to enable parallel jobs to be scheduled efficiently on IBM SP2 systems, however, various versions supporting other systems are now available. EASY-LL Scheduler EASY-LL is an API that can combine LoadLeveler and EASY. The gang scheduler permits a set of processes, or multiple threads from a single process, to be scheduled concurrently as a group. Grid Engine Scheduler Scheduler Permits a set of processes, or multiple threads from a single process, to be scheduled concurrently as a group. A scheduling system that accepts job submission by users and schedules them for execution on appropriate systems in the Grid based on resource management policies. A software system that uses scheduling models to predict paper and take action to implement the resulting schedule. The goal is to optimize the performance experienced by the application on computational grid. The result is an Application Schedule. Job Scheduler Scheduler Establishing a job queue to run a sequence of jobs (programs) over any period of time Load Scheduler Scheduler Aworkload management and scheduling system for serial and parallel jobs over a cluster of servers. Load Sharing Facility – load sharing and sophisticated batch scheduling across distributed UNIX and Windows NT computing environments. Machine Scheduler, Resource Management Meta-Scheduler Scheduler Scheduler, Resource Management Meta-Scheduler Scheduler, Resource Management Meta-Scheduler Scheduler Determine application on a machine. Priority, length of time in the job queue and available resources are examples of oriteria used. A scheduler sexual so to request resources of more than one machine for a single job. May perform Load Balancing of workloads across multiple systems. Each system would then have its own local schedule	Dater Queue		from/runs.

			management system.

Scheduling	Scheduler	The process of ordering tasks on compute resources and ordering communication between tasks. Also, known as the allocation of computation and communication "over time."
Scheduling	Scheduler,	A procedure used by a scheduler to determine when a job can
Algorithm	Resource	run.
	Management	
Scheduling	Scheduler	Consists of a Scheduling Policy, a program model, a
Model		performance model, and a performance measure.
Scheduling	Scheduler	A set of rules for producing schedules.
Policy		-
Staging	Scheduler,	The process of moving a file or files to the host before the Batch
	Resource	Job begins execution.
	Management	
Submit Jobs	Scheduler	The process of placing a job into a Queue for execution.
Super	Scheduler	The process that will (1) discover available resources for a job,
Scheduler		(2) select the appropriate system(s), and (3) submit the job.
		Each system would then have its own local scheduler to
		determine how its job queue is processed (see Meta-Scheduler).

Wolfgang Ziegler Fraunhofer Institute for Scientific Computing and Algorithms D – 53754 Sankt Augustin Wolfgang.Ziegler@scai.fhg.de

6. Glossary

A glossary is not required for this document.

7. Intellectual Property Statement

The GGF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the GGF Secretariat.

The GGF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this recommendation. Please address the information to the GGF Executive Director.

8. Full Copyright Notice
