[Text Slide A]

XML Schema and Namespace.
==
The current schema uses the namespace " http://www.gridforum.org/JSDL";. Do we need to document that in the spec? If so, should we make http://www.gridforum.org/JSDL final.

- So we should change this to: http://www.ggf.org/namespaces/2004/11/jsdl-0.9.xsd

OASIS
http://docs.oasis-open.org/wsrf/2004/05/wsrf-WS-ResourceLifetime-1.2-draft-01.xsd

==

Extension Name and version tag
==
We have talked about people being able to generate their own extension set to JSDL. It would be useful to allow a document not only to be taged with the JSDL version that it is written in but also the names of the extension sets that have been used and the version of those extension sets. Discuss

Where do we put this information inside the JobDefinition attributes or outside of the JobDefinition Element completely? or Ignore it completely.

<JobDefinition xmlns="http://www.ggf.org/namespaces/2004/11/jsdl-0.9.xsd"
xmlns:foo="http://bar.fifi">

</JobDefinition>

Darren> This needs to be added to the Spec in the Extension section. And to the JobDefinition section we need to remove version and replace it with xmlns not required attribute. It just needs to be in an appropriate namespace for the document.
==

Port Ranges for Web services

==========================

Extension can be used for this right now. We should put this in as an example as an extension. This can be retrieved from the email list.

==========================

QName version Token

===================

All enumerations that we developed should be done with QName instead of Token.
QName is more flexible for extension.

Darren> Spec needs to change
Steve> Schema needs to change

====================
Assignments
Darren> Schema and Spec consistency needs to be checked again. Darren can get a tech writer to do this.
