Web Services Data Access and Integration – The Relational Realisation (WS-DAIR)

Status of This Memo

This memo provides information regarding the specification of service-based interfaces to relational data resources. The specification is presently a draft for discussion. It does not define any standards or technical recommendations. Distribution is unlimited.

Abstract

Data resources play a significant role in many applications across multiple domains. Web services provide implementation neutral facilities for describing, invoking and orchestrating collections of networked resources. The GGF (Global Grid Forum) Open Grid Services Architecture (OGSA), and its associated specifications, defines consistent interfaces through web services between components of the grid infrastructure. Both the web and grid communities would benefit from the provision of consistent and agreed web service interfaces for data resources and the systems that manage them.

This document, *Web Services Data Access and Integration: The Relational Realisation (WS-DAIR)*, presents a specification for a collection of data access interfaces for relational data resources, which extends interfaces defined in the *Web Services Data Access and Integration* document [WS-DAI].

Related DAIS specifications define how other data resources and systems can be described and manipulated through web services. The DAIS specifications form part of a broader activity within the GGF to develop OGSA. The DAIS specifications can be applied in regular web services environments or as part of a grid fabric.

1. Introduction

Data access plays a central role for many types of Grid applications. Data access generally involves the retrieval, manipulation and insertion of data, which may be stored using a range of different formats and infrastructures.

This document presents a specification for a collection of data access interfaces for relational Data Resources. A relational Data Resource is a data source/sink, together with any associated management infrastructure, that is characteristic of relational database systems, e.g., can be queried or updated using SQL or any other suitable relational query/update language. The interfaces are thus categorized according to the support they provide for:

- Data Description
- Data Access
- Data Factories
- Data Management

As such, this document should be read in conjunction with the generic *Web Services Data Access and Integration* document [WS-DAI], which defines the base interfaces that are extended in this document. These specifications are being developed for representing data resources as web services, and form part of a broader activity within the Global Grid Forum to develop the Open Grid Services Architecture (OGSA) [OGSA]. This document does not mandate how the interfaces are composed into services. The proposed interfaces may be used in isolation or in conjunction with others.

1.1 Specification Scope

The DataAccess, DataFactory and DataManagement interfaces and the role of Data Description in the provision of service-based interfaces to Data Resources are discussed in the *Web Services Data Access and Integration* document [WS-DAI]. This specification extends those interfaces to allow access to and description of relational Data Resources. The relational Data Resources are assumed to be composed of databases and tables, which are accessible using SQL. In addition, common relational resources such as stored procedures are also described.

The DataManagement interface has not been considered fully, but information on this topic is retained in Section 8.

1.2 Specification Organisation

This specification separates the function of a Data Service from its operational representation as expressed in WSDL. This approach allows functions to be mapped to WSDL in many different ways and a single such mapping is provided in Section 9.

The relational model is described using the terminology defined in Section 3 and employs the concepts described in Section 4. Sections 5, 6, 7 and 8 present the Data Description, Data Access, Data Factory and Data Management aspects of the relational model respectively.

A mapping of the relational model to the Web Services Resource Framework (WSRF) is described in Section 9, Section 10 discusses security and Section 11 draws conclusions from this specification exercise.

1.3 Interface Composition

This specification does not mandate how interfaces are composed into services; the proposed interfaces may be used in isolation or in conjunction with others. Viable compositions of interfaces will, initially, follow established patterns for data access.

Here a Data Service provides `SQLAccess`, `SQLResponseAccess` and `SQLRowSetAccess` interfaces for a relational Data Service that is associated with a relational database.

2. Notational Conventions

The key words “MUST,” “MUST NOT,” “REQUIRED,” “SHALL,” “SHALL NOT,” “SHOULD,” “SHOULD NOT,” “RECOMMENDED,” “MAY,” and “OPTIONAL” are to be interpreted as described in RFC-2119 [RFC2199].

When describing concrete XML schemas, this specification uses the notational convention of [WS-Security]. Specifically, each member of an element’s children or attributes property is described using an XPath-like notation (e.g., `/x:MyHeader/x:SomeProperty/@value1` indicates that namespace *x* is being used, the root element *MyHeader* and a child element *SomeProperty* with an attribute *value1*). The use of `{any}` indicates the presence of an element wildcard (`<xsd:any/>`). The use of `@{any}` indicates the presence of an attribute wildcard (`<xsd:anyAttribute/>`).

When patterns of messages are described the layout of the XML of each message is presented, as opposed to the XML schema. The following notation is used to indicate cardinality of XML elements in these cases:

- * zero or more
- + one or more
- ? zero or one

Where no notation is added to an element only one instance of the element is expected.

This specification uses namespace prefixes throughout; these are listed in the table below. Note that the choice of any namespace prefix is arbitrary and is not semantically significant.

Prefix	Namespace
http	http://www.w3.org/2002/06/wsdl/http
wsdl	http://schemas.xmlsoap.org/wsdl/
xsd	http://www.w3.org/2001/XMLSchema
wsdai	http://www.ggf.org/namespaces/2004/09/WS-DAI
wsdair	http://www.ggf.org/namespaces/2004/09/WS-DAIR
wsdaisr	http://www.ggf.org/namespaces/2004/09/WS-DAISR
wsdairs	http://www.ggf.org/namespaces/2004/09/WS-DAIRS
wrs	http://java.sun.com/xml/ns/jdbc/webrowset.xsd
wsa	http://schemas.xmlsoap.org/ws/2004/03/addressing

3. Terminology

The model independent terminology, i.e., Data Resource, Data Service, Consumer and Data Set, is given in the *Web Services Data Access and Integration* document [WS-DAI].

4. Concepts

4.1 Types of Interface

DAIS classes its interfaces into four broad categories, which are defined in the WS-DAI specification. They are extended in this document to target relational data resources.

4.1.1 Data Description

The *DataDescription* interfaces allow a description of data represented by Data Services to be provided. The model independent specification for these is given in the *Web Services Data Access and Integration* document [WS-DAI]. Here they are extended to provide a description of relational Data Resources. These are the main points of extension for relational Data Resources:

- *SQLAccessDescription*: provides information about *LanguageCapabilities* and relational logical schemas that describe Databases, Domains, Tables, Constraints, Columns, ColumnTypes, Keys, Views, StoredProcedures, UserDefinedTypes, UserDefinedFunctions and Triggers that a Data Service may represent. It also describes physical schemas that describe indexes, sizes of tables and statistics on column values.
- *SQLResponseDescription*: provides information about the values represented by a *SQLExecuteResponseType* including *SQLResponseItemSequenceNumber* and *SQLResponseItemFormatType* (one of each of the two preceeding for each Item in a *SQLResponse*). In addition the *NumberOfSQLRowSets*, *NumberOfSQLUpdateCounts*, *NumberOfSQLReturnValues*, *NumberOfSQLOutputParameters* and *NumberOfSQLCommunicationsAreas* are also provided
- *SQLRowSetDescription*: provides information about a particular instance of a query result that a Data Service may represent. This interface will make available information about the schema for representing the query result and the number of rows within the *SQLRowSet*.

These capabilities are described in Section 5.

4.1.2 Data Access

DataAccess operations allow relational Data Resources to be modified through insertion, updates or deletes, or queried through an appropriate language. Some relational Data Resource products also support XML access – these are addressed in the WS-DAIX specification. The following Data Access interfaces are defined in this specification:

- *SQLAccess*: provides access to a relational Data Resource.
- *SQLResponseAccess*: provides access to each type of Response that can result from the execution of a *SQLExpression*.
- *SQLRowSetAccess*: provides access to a set of rows, which are usually the result of a *SQLExpression* containing a SELECT statement.

These are covered in more detail in Section 6.

4.1.3 Data Factory

The *DataFactory* interfaces allow data represented in relational Data Resources, usually as the result of a query or update, to be instantiated as Data Services. The specializations in this instance thus deal with the type of *SQLExpression* that can be passed to a *DataFactory* to expose the results in a meaningful fashion. The properties and interfaces that will be supported

by these Data Services are specified in the schema for the creation parameters. *DataFactory* specializations are:

- *SQLAccessFactory*: provides access to a relational Data Resource.
- *SQLResponseFactory*: provides access to a SQL response.

These are covered in more detail in Section 7.

4.2 Relationships with other specifications

WS-DAIR does not provide its own query/update languages for relational Data Resources. Instead, it acts as a conduit for existing relational query and update languages to be conveyed to the appropriate relational Data Resources, in this instance relational Data Resources or a Data Resource that supports relational type queries. As such WS-DAIR relies on existing relational query and update languages. In this document, interface support is provided for languages based on the following standards:

- SQL: an ISO standard defining a language for querying and updating relational Data Resources [SQL2003].
- WebRowSet: a Java Community Process standard for relational results is one of the valid *ResponseFormats* for responses from *SQLAccess* operations [JSR114].
- CIM: is the Common Information Model, a DMTF standard, to which the DAIS-WG and the CGS-WG plan to submit a proposal for extension to include relational database properties and data management operations [CIM].

5. Data Description

The Data Description interfaces allow metadata (properties) to be made available and are provided for use with relational Data Resources and for *SQLRowSets*.

5.1 SQLAccessDescription

5.1.1 Behavioral Properties

The metadata described in this section are associated with a relational Data Resource.

5.1.1.1 LanguageCapabilities

```
<xsd:simpleType name="LanguageCapabilitiesType">
  <xsd:union>
    <xsd:simpleType>
      <xsd:restriction base="xsd:token">
        <xsd:enumeration value="SQL92Expression"/>
        <xsd:enumeration value="SQL99Expression"/>
        <xsd:enumeration value="SQL03Expression"/>
        <xsd:enumeration value="SQL07Expression"/>
        <xsd:enumeration value="AstronomyDataQueryLanguage"/>
      </xsd:restriction>
    </xsd:simpleType>
    <xsd:simpleType>
      <xsd:restriction base="xsd:token"/>
    </xsd:simpleType>
  </xsd:union>
</xsd:simpleType>

<xsd:element name="LanguageCapabilities"
  type="wsdair:LanguageCapabilitiesType" />
```

/wsdair:LanguageCapabilities

Describes the dialect of the SQL language that the underlying relational database management system should support. This is an extensible list and possible values would be a subset of *SQL92Expression*, *SQL99Expression*, *SQL03Expression*, *SQL07Expression* and *AstronomyDataQueryLanguage*, for example.

The values for the above property will be defined in a proposal arising from a joint activity of the DAIS-WG and the CGS-WG to extend the DMTF Common Information Model [CIM]. The "Content" element at the moment is purely acting as a temporary placeholder.

5.1.1.2 SQLExecuteResponseTypeList**5.1.1.3 SQLExecuteFactoryPropertyDocumentTypeList****5.1.2 Informational Properties**

Data Description provides information about a single relational Data Resource represented by a Data Service. Note the details and values of the complex types below will be defined in a proposal arising from a joint activity of the DAIS-WG and the CGS-WG to extend the DMTF Common Information Model [CIM]. The "Content" element at the moment is purely acting as a temporary placeholder.

5.1.2.1 RelationalSchema

```
<xsd:complexType name="RelationalSchemaType">
  <xsd:sequence>
    <xsd:element name="Content" type="xsd:string"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="RelationalSchema"
  type="wsdair:RelationalSchemaType"/>
```

/wsdair:RelationalSchema

Describes the schema of the relational data, for example Databases, Domains, Tables, Constraints, Columns, ColumnTypes, Keys, Views and Indexes.

5.1.2.2 StoredProcedures

```
<xsd:complexType name="StoredProceduresListType">
  <xsd:sequence>
    <xsd:element name="Content" type="xsd:string"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="StoredProcedures"
  type="wsdair:StoredProceduresListType" />
```

/wsdair:StoredProcedures

Describes the names, input and output types of the stored procedures available.

5.1.2.3 UserDefinedTypes

```
<xsd:complexType name="UserDefinedTypesListType">
  <xsd:sequence>
```

```

        <xsd:element name="Content" type="xsd:string"/>
      </xsd:sequence>
    </xsd:complexType>

    <xsd:element name="UserDefinedTypes"
      type="wsdair:UserDefinedTypesListType" />

```

/wsdair:UserDefinedTypes

Describes the names and definitions of the user-defined types available.

5.1.2.4 UserDefinedFunctions

```

<xsd:complexType name="UserDefinedFunctionsListType">
  <xsd:sequence>
    <xsd:element name="Content" type="xsd:string"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="UserDefinedFunctions"
  type="wsdair:UserDefinedFunctionsListType" />

```

/wsdair:UserDefinedFunctions

Describes the names and definitions of the user-defined functions available.

5.1.2.5 Triggers

```

<xsd:complexType name="Triggers">
  <xsd:sequence>
    <xsd:element name="Content" type="xsd:string"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="Triggers" type="wsdair:TriggersType" />

```

/wsdair:Triggers

Describes the names and definitions of the triggers available.

5.2 SQLResponseDescription

5.2.1 Behavioral Properties

5.2.1.1 GetSQLRowsetResponseTypeList

5.2.1.2 SQLRowsetSelectionFactoryParameterDocumentTypeList

5.2.2 Informational Properties

5.2.2.1 SQLResponseItem

```

<xsd:complexType name="SQLResponseItemType">
  <xsd:sequence>
    <xsd:element name="SQLResponseItemSequenceNumber" type="xsd:int" />
    <xsd:element name="SQLResponseItemFormatType" type="xsd:string" />
  </xsd:sequence>
</xsd:complexType>

```

```
<xsd:element name="SQLResponseItem"
  type="wsdair:SQLResponseItemType"/>
```

/wsdair:SQLResponseItem

This comprises two properties, namely *SQLResponseItemSequenceNumber*, the Sequence Number of a *SQLResponseItem* in the *SQLExecuteResponse* which is paired with *SQLResponseItemFormatType*, the Format Type for that same *SQLResponseItem*.

5.2.2.2 NumberOfSQLRowSets

```
<xsd:element name="NumberOfSQLRowSets" type="xsd:int" />
```

/wsdair:NumberOfSQLRowSets

The total number of *SQLRowSets* in the *SQLExecuteResponse*.

5.2.2.3 NumberOfSQLUpdateCounts

```
<xsd:element name="NumberOfSQLUpdateCounts" type="xsd:int" />
```

/wsdair:NumberOfSQLUpdateCounts

The total number of *SQLUpdateCounts* in the *SQLExecuteResponse*.

5.2.2.4 NumberOfSQLReturnValues

```
<xsd:element name="NumberOfSQLReturnValues" type="xsd:int" />
```

/wsdair:NumberOfSQLReturnValues

The total number of *SQLReturnValues* in the *SQLExecuteResponse*.

5.2.2.5 NumberOfSQLOutputParameters

```
<xsd:element name="NumberOfSQLOutputParameters" type="xsd:int" />
```

/wsdair:NumberOfSQLOutputParameters

The total number of *SQLOutputParameters* in the *SQLExecuteResponse*.

5.2.2.6 NumberOfSQLCommunicationsAreas

```
<xsd:element name="NumberOfSQLCommunicationsAreas" type="xsd:int" />
```

/wsdair:NumberOfSQLCommunicationsAreas

The total number of *SQLCommunicationsAreas* in the *SQLExecuteResponse*.

5.3 SQLRowSet Description

5.3.1 Behavioral Properties

The metadata described in this section are associated with a *SQLRowSet*.

5.3.1.1 AccessMode

```
<xsd:complexType name="AccessModeType">
  <xsd:sequence>
    <xsd:element name="Content" type="xsd:string" minOccurs="0"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="AccessMode" type="wsdair:AccessModeType" />
```

/wsdairs:AccessMode

Describes how the `SQLRowSet` can be navigated, for example sequentially in a forward direction; whether random access is allowed, etc. Possible values would be zero or more from a set of values which will be implementation specific, for example `ForwardSequential`, `RandomAccess`. The "Content" element at the moment is purely acting as a temporary placeholder.

5.3.1.2 DataAccessibleOverTxnBoundary

```
<xsd:element name="DataAccessibleOverTxnBoundary" type="xsd:boolean" />
```

/wsdairs:DataAccessibleOverTxnBoundary

Describes whether the `SQLRowSet` can still be navigated after a transaction has been committed.

5.3.1.3 GetTuplesResponseTypeList**5.3.2 Informational Properties****5.3.2.1 SQLRowSetSchema**

```
<xsd:complexType name="SQLRowSetSchemaType">
  <xsd:sequence>
    <xsd:element ref="wrs:metadata"/>
  </xsd:sequence>
</xsd:complexType>

<xsd:element name="SQLRowSetSchema"
  type="wsdairs:SQLRowSetSchemaType" />
```

/wsdairs:SQLRowSetSchema

For example, `WebRowSet`, see [JSR114].

5.3.2.2 NumberOfRows

```
<xsd:element name="NumberOfRows" type="xsd:int" />
```

/wsdairs:NumberOfRows

The total number of rows in the result set.

5.4 SQLAccessFactoryDescription**5.4.1 Behavioral Properties**

None are currently defined.

6. Data Access**6.1 SQLAccess**

This `SQLAccess` interface provides access to the underlying relational Data Resource by means of SQL statements.

6.1.1 Overview

Data Access collects together messages that directly access and modify the data represented by a Data Service along with the behavioral properties that describe the behavior of these access messages, as, for example, illustrated in Figure 1.

A relational Data Service implements the *SQLAccess* operations and exposes the *SQLAccessDescription* informational properties. In this example a consumer uses the *SQLExecute* message to submit a *SQLExpression*. The associated *SQLExecuteResponse* message will contain some combination of *SQLExecuteResponseTypeList*. The actual combination will depend upon the actual *SQLExpression*, for example:

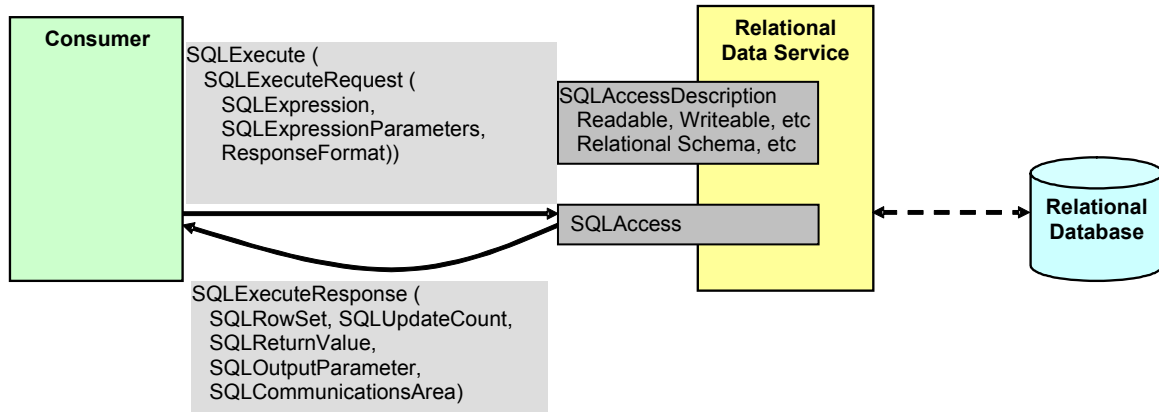

Figure 1 – Overview – SQLAccess

- Usage of SELECT produces:
 - *SQLRowSet* – (1)
 - *SQLCommunicationsArea* – (*)
- Usage of INSERT, UPDATE, DELETE produces:
 - *SQLUpdateCount* – (1)
 - *SQLCommunicationsArea* – (*)
- Usage of a StoredProcedure produces:
 - *SQLRowSet* – (*)
 - *SQLReturnValue* – (*)
 - *SQLOutputParameter* – (*)
 - *SQLCommunicationsArea* – (*)
- Usage of a UserDefinedFunction produces:
 - *SQLReturnValue* – (+)
 - *SQLCommunicationsArea* – (*)

The Consumer will need to process the *SQLExecuteResponse* appropriately.

6.1.2 Operations

6.1.2.1 SQLAccess::SQLExecute

Directs a *SQLExpression* and optional *SQLExecuteRequestParameters* to the relational Data Resource.

The *SQLExecuteRequestParameters* are primarily for use with Stored Procedures and User Defined Functions. However, it is also intended that a *SQLExecuteRequestParameter* be used to provide a dataset reference to a *SQLExpression* containing a bulk load or similar update statement.

Input

- *SQLExecuteRequest* – the *SQLExecute* operation that is to be run on the relational Data Resource.
 - *SQLExpression* – (1) – any SQL statement
 - *SQLExpressionParameters* – (*)
 - *ResponseFormat* – the format(s), selected from the *SQLExecuteResponseTypeList* property, which the *SQLExecuteResponse* will conform to.

Output

- *SQLExecuteResponse* – the *SQLExecuteResponse* returned in the *ResponseFormats* from the *SQLExecute* operation.
 - *SQLRowSet* – (*) – e.g. *WebRowSet* see [JSR114]
 - *SQLUpdateCount* – (*)
 - *SQLReturnValue* – (*)
 - *SQLOutputParameter* – (*)
 - *SQLCommunicationsArea* – (*)
 - *SQLState* – (+) – an XOPEN or SQL99 code identifying the Exception, Warning or Message.
 - *VendorCode* – (+) – a database vendor-specific code for the Exception, Warning or Message.
 - *MessageText* – (+) – a text description of the Exception, Warning or Message.

Faults

- *InvalidSQLExecuteRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLExpressionParameters* – Parameters do not match *SQLExpression*.
- *InvalidResponseFormat* – *ResponseFormat* not valid.
- *OtherFault* – any other fault.

6.2 SQLResponseAccess

This allows access to each *SQLExecuteResponseType* in the *SQLExecuteResponse* data by executing the appropriate *SQLResponseAccess* operation.

6.2.1 Operations**6.2.1.1 SQLResponseAccess::GetSQLResponseItem**

Return a specified number of Items from a service that represents a SQL Response. This provides an alternative way to access SQL Response Items to the operations (*GetSQLRowSet*, *GetSQLUpdateCount*, etc) for *SQLResponseAccess*. The Response Format for each Item is obtained from the associated *SQLResponseItem* Informational Property.

Input

- *GetSQLResponseItemRequest*
 - *StartPosition* – the position of the first SQL Response Item to be returned (First Item is position 1).
 - *Count* – the number of SQL Response Items.

Output

- *GetSQLResponseItemResponse*
 - *SQLResponseItem* – (+) – e.g. *SQLRowSet*, *SQLUpdateCount*, etc.

Faults

- *InvalidGetSQLResponseItemRequest* – XML syntax error or XML schema non-compliance.
- *InvalidStartPosition* – not a valid *StartPosition*; cannot start with SQL Response Item specified (out of bounds value).
- *InvalidCount* – not a valid *Count*; cannot return that number of Response Items.

- *OtherFault* – any other fault.

6.2.1.2 SQLResponseAccess::GetSQLRowSet

Get a *SQLRowSet* from the *GetSQLRowSetResponse*.

Input

- *GetSQLRowSetRequest*
 - *SQLRowSetNumber* – (1) – the number of the required *SQLRowSet*.

Output

- *GetSQLRowSetResponse*
 - *SQLRowSet* – (1) – the requested *SQLRowSet* e.g. *WebRowSet* see [JSR114].

Faults

- *InvalidGetSQLRowSetRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLRowSetNumber* – not a valid *SQLRowSetNumber*.
- *OtherFault* – any other fault.

6.2.1.3 SQLResponseAccess::GetSQLUpdateCount

Get a *SQLUpdateCount* from the *GetSQLUpdateCountResponse*.

Input

- *GetSQLUpdateCountRequest*
 - *SQLUpdateCountNumber* – (1) – the number of the required *SQLUpdateCount*.

Output

- *GetSQLUpdateCountResponse*
 - *SQLUpdateCount* – (1) – the requested *SQLUpdateCount*.

Faults

- *InvalidSQLUpdateCountRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLUpdateCountNumber* – not a valid *SQLUpdateCountNumber*.
- *OtherFault* – any other fault.

6.2.1.4 SQLResponseAccess::GetSQLReturnValue

Get a *SQLReturnValue* from the *GetSQLReturnValueResponse*.

Input

- *GetSQLReturnValueRequest*
 - *SQLReturnValueNumber* – (1) – the number of the required *SQLReturnValue*.

Output

- *GetSQLReturnValueResponse*
 - *SQLReturnValue* – (1) – the requested *SQLReturnValue*.

Faults

- *InvalidGetSQLReturnValueRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLReturnValueNumber* – not a valid *SQLReturnValueNumber*.
- *OtherFault* – any other fault.

6.2.1.5 SQLResponseAccess::GetSQLOutputParameter

Get a *SQLOutputParameter* from the *GetSQLOutputParameterResponse*.

Input

- *GetSQLOutputParameterRequest*
 - *SQLOutputParameterNumber* – (1) – the number of the required *SQLOutputParameter*.

Output

- *GetSQLOutputParameterResponse*

- *SQLOutputParameter* – (1) – the requested *SQLOutputParameter*.

Faults

- *InvalidSQLOutputParameterRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLOutputParameterNumber* – not a valid *SQLOutputParameterNumber*.
- *OtherFault* – any other fault.

6.2.1.6 SQLResponseAccess::GetSQLCommunicationsArea

Get a *SQLCommunicationsArea* from the *GetSQLCommunicationsAreaResponse*.

Input

- *GetSQLCommunicationsAreaRequest*
 - *SQLCommunicationsAreaNumber* – (1) – the number of the required *SQLCommunicationsArea*.

Output

- *GetSQLCommunicationsAreaResponse*
 - *SQLCommunicationsArea* – (1) – the requested *SQLCommunicationsArea*.
 - *SQLState* – (+) – an XOPEN or SQL99 code identifying the Exception, Warning or Message.
 - *VendorCode* – (+) – a database vendor-specific code for the Exception, Warning or Message.
 - *MessageText* – (+) – a text description of the Exception, Warning or Message.

Faults

- *InvalidSQLCommunicationsAreaRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLCommunicationsAreaNumber* – not a valid *SQLCommunicationsAreaNumber*.
- *OtherFault* – any other fault.

6.3 SQLRowSetAccess

This allows access to the underlying data by means of rows.

6.3.1 Operations**6.3.1.1 SQLRowSetAccess::GetTuples**

Return a specified number of tuples from a service that represents a result set.

Input

- *GetTuplesRequest*
 - *StartPosition* – the position of the first tuple to be returned (First tuple is position 1).
 - *Count* – the number of tuples.

Output

- *GetTuplesResponse*
 - *SQLRowSet* – (1) – e.g. *WebRowSet* see [JSR114].
 - *SQLCommunicationsArea* – (*)
 - *SQLState* – (+) – an XOPEN or SQL99 code identifying the Exception, Warning or Message.
 - *VendorCode* – (+) – a database vendor-specific code for the Exception, Warning or Message.
 - *MessageText* – (+) – a text description of the Exception, Warning or Message.

Faults

- *InvalidGetTuplesRequest* – XML syntax error or XML schema non-compliance.
- *InvalidStartPosition* – not a valid *StartPosition*; cannot start with tuple specified (out of bounds value).

- *InvalidCount* – not a valid Count; cannot return that number of tuples.
- *OtherFault* – any other fault.

7. Data Factory

7.1 SQLAccessFactory

The SQLExecuteFactory operation is used to create a service representing a relational Data Resource, which fulfills the desired behavior, exposes the desired interfaces and represents the results of the SQL Query.

7.1.1 Overview

This factory pattern allows a Data Service to relational Data Resource relationship to be established as a result of messages going to another Data Service. This ability to derive one Data Service from another to provide different views of the same relational Data Resources leads to a collection of notionally related Data Service instances, for example, see Figure 2.

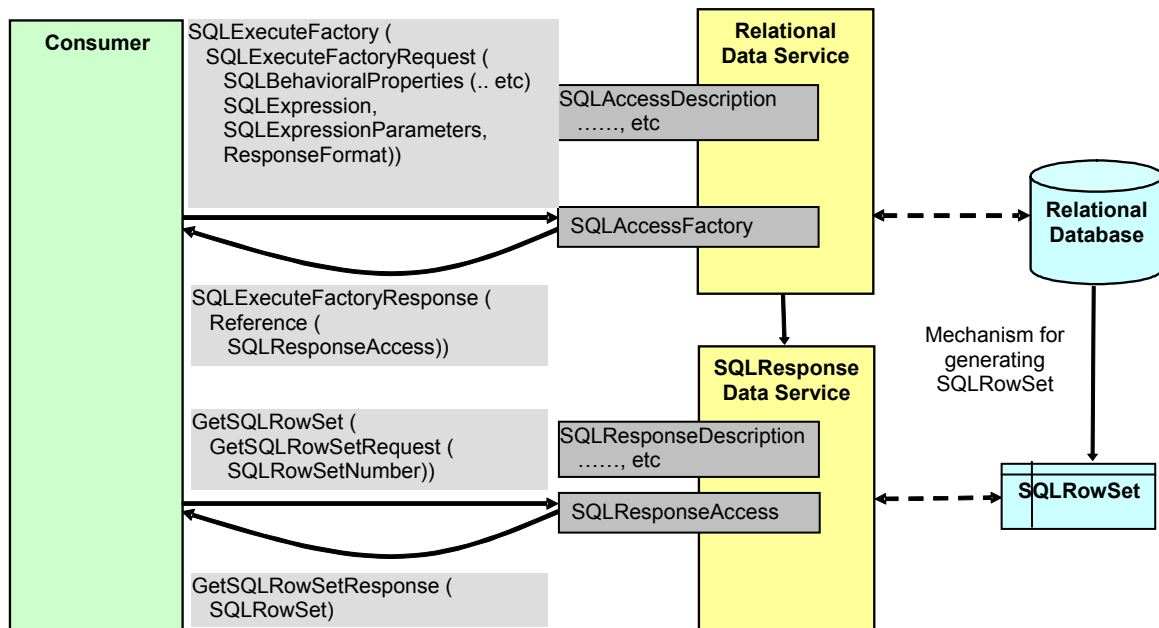

Figure 2 – Overview – SQLAccessFactory

The example in Figure 2 presents a SQLAccess interface. The SQLExecuteFactory operation is used to construct the derived SQLResponse Data Service. This service provides access to the *SQLRowSet* resulting from a *SQLExpression* against the Relational Database, assuming that the expression contains a SELECT statement. The *SQLRowSet* is a subset or restriction of the data in the database and is presented in tabular form. The *SQLRowSet* could be stored as a table in a relational database or decoupled from the database, but the important distinction here is that the data is represented as a collection of rows that does not implement the SQLAccess portType. Instead, the SQLResponse Data Service presents the *SQLResponseAccess* collection of operations that allows the *SQLRowSet* to be retrieved but does not provide facilities for submitting SQL expressions.

7.1.2 Operations

7.1.2.1 SQLAccessFactory::SQLExecuteFactory

Create a new Data Service that corresponds to the results of a SQL Query.

Input

- *SQLExecuteFactoryRequest*
 - *PropertiesDocument* – Behavioral Properties for target data service
 - *SQLExpression* – (1) – any SQL statement.
 - *SQLExpressionParameters* – (*)

Output

- *SQLExecuteFactoryResponse*
 - *Reference* – (1) – to *SQLResponseAccess* operation.

Faults

- *InvalidSQLExecuteFactoryRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLBehavioralProperties* – Properties not valid.
- *InvalidSQLExpressionParameters* – *SQLExpressionParameters* do not match *SQLExpression*.
- *InvalidResponseFormat* – *ResponseFormat* not valid.
- *OtherFault* – any other fault.

7.2 SQLResponseFactory

The *SQLResponseFactory* is used to create a service representing a row set.

7.2.1 Overview

The example in Figure 3 presents a *SQLResponseFactory* interface. The *SQLExecuteFactory* operation is used to construct the derived *SQLResponse Data Service*; the *SQLResponseFactory* operation of which is in turn used to construct the derived *SQLRowSet Data Service*. This service provides access to tuples in the *SQLRowSet* resulting from a *SQLExpression* against the Relational Database.

7.2.2 Operations**7.2.2.1 SQLResponseFactory::SQLRowSetSelectionFactory**

Get a *Reference* to a *SQLRowSetAccess* from the *SQLRowSetSelectionFactoryResponse*.

Input

- *SQLRowSetSelectionFactoryRequest*
 - *PropertiesDocument* – Behavioral properties for target data service
 - *SQLRowSetSelectionNumber* – (1) – the number of the required *SQLRowSet*.

Output

- *SQLRowSetSelectionFactoryResponse*
 - *Reference* – (1) – to *SQLRowSetAccess* operation which provides access to the requested *SQLRowSet*.

Faults

- *InvalidSQLRowSetSelectionFactoryRequest* – XML syntax error or XML schema non-compliance.
- *InvalidSQLRowSetSelectionNumber* – not a valid *SQLRowSetSelectionNumber*.
- *OtherFault* – any other fault.

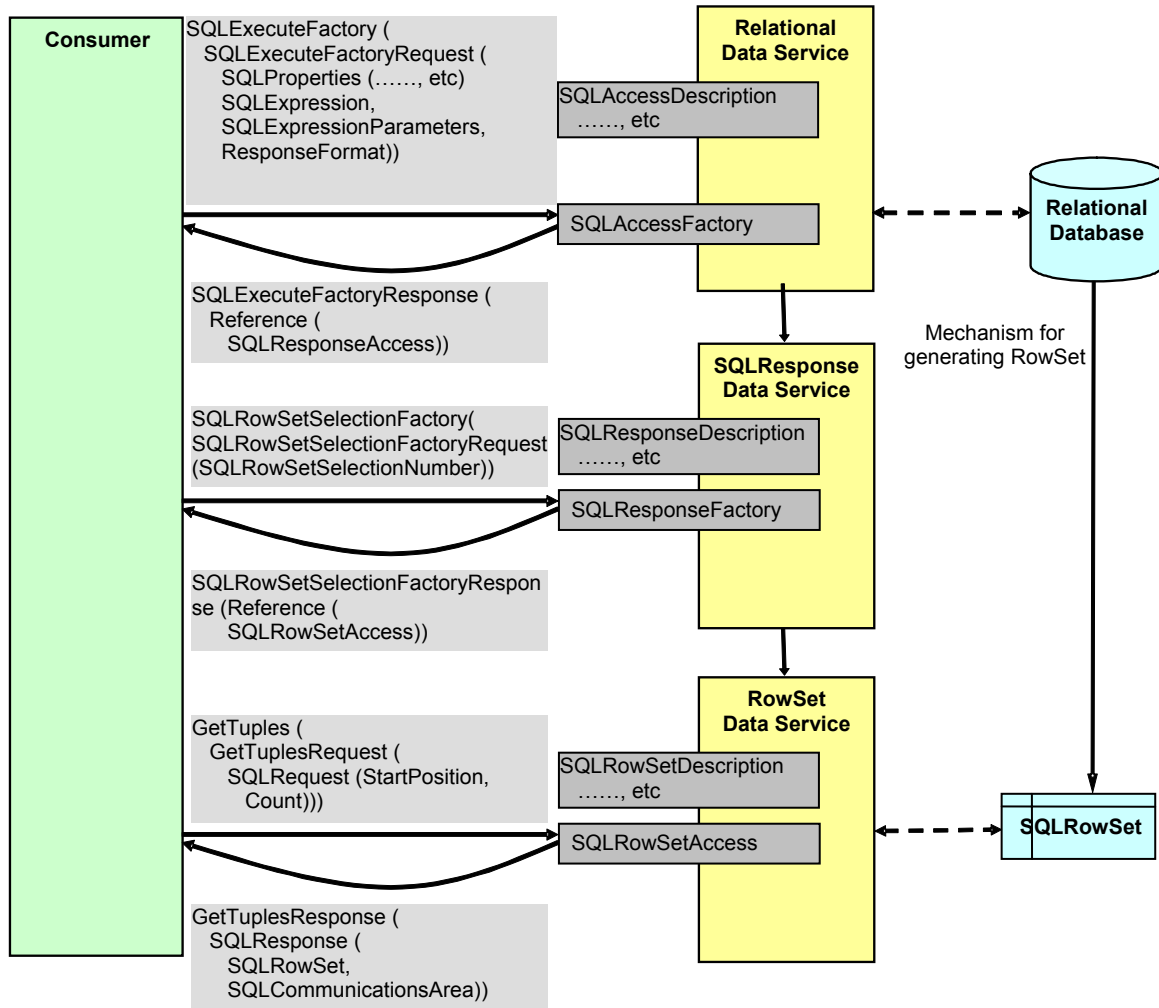

Figure 3 – Overview – SQLResponseFactory

8. Data Management

See the relevant section in the *Web Services Data Access and Integration* document [WS-DAI] for details.

9. Mapping to WSRF

For a mapping to the Web Services Resource Framework (WSRF) proposal see the following Sections:

- SQLAccess
 - WSDL Interfaces – Appendix A.1
 - XML Schema – Appendix A.2
 - WSDL – Appendix A.3
- SQLResponseAccess
 - WSDL Interfaces – Appendix B.1
 - XML Schema – Appendix B.2
 - WSDL – Appendix B.3
- SQLRowSetAccess
 - WSDL Interfaces – Appendix C.1
 - XML Schema – Appendix C.2
 - WSDL – Appendix C.3

10. Security Considerations

The relational realization of a Grid Data Service will use standard Grid Security mechanisms as specified by OGSA Security working group combined with standard ways of relating Grid credentials and authorities to resource access rights. The assumption is that these standards will also indicate how to make information related to authentication, authorization security etc available.

11. Conclusion

This document has discussed a specialization of the interfaces defined in the *Web Services Data Access and Integration* document [WS-DAI] and the additional capabilities required to properly address relational Data Resources. This is work in progress and feedback is welcomed on this document.
