
Grids in Asia Pacific

What has been done? and what hasn't?

Yoshio Tanaka
Grid Technology Research Center,
AIST, Japan

ApGrid: Asia Pacific Partnership for Grid Computing

● Open community for Grid researchers in Asia Pacific

● ApGrid can be

- ▶ A meeting point for all Asia-Pacific Grid researchers
- ▶ A communication channel to the GGF, and other grid communities (e.g. TeraGrid UK-eScience FUGrid etc.)

Asia-Pacific Grid

A pool for finding in

15 countries, 49 organizations

ApGrid Testbed – unique features –

- Truly (naturally) multi national/political/institutional VO beyond boundaries

- ▶ Not an application-dedicated testbed – general platform
- ▶ Diversity of languages, culture, policy, interests, ...

Tin hàng ngày

- Grid BYO – Grass roots approach

- ▶ Each institution contributes his resources for sharing
- ▶ Not a single source funded for the development

- Physical resources

- ▶ Most contributed resources are small-scale clusters
- ▶ Networking is there, however the bandwidth is not enough

- We can

- ▶ have experiences on running international VO

- ▶ verify the feasibility of development

Asia-Pacific Grid

PRAGMA Pacific Rim Application and Grid Middleware Assembly

- NSF-funded project lead by UCSD/SDSC.
- 1st workshop was held in March 2002.
- Establish sustained collaborations and advance the use of the Grid technologies for applications.
- Expected outcomes:
 - ▶ Advance scientific applications
 - ▶ Increase productive and effective use of the grid by researchers and scientists in the Pacific Rim
 - ▶ Increase interoperability of grid middleware in Pacific Rim
- Tightly collaborating with ApGrid.
- Having workshops 2~3 times a year.

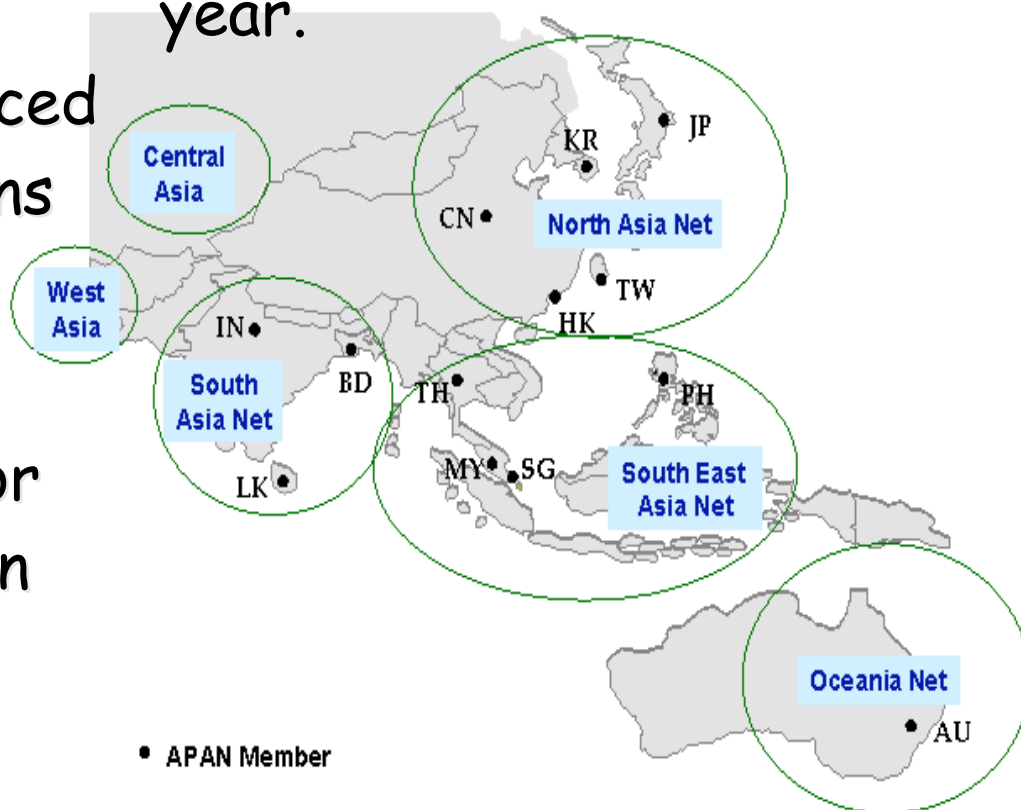

Grid

Center

Asia Pacific Grid

- Non-profit international consortium established on 3 June 1997.
- Being a high-performance network for R&D on advanced next generation applications and services.
- Providing an advanced networking environment for the research and education community in Asia-Pacific.
- Promoting global collaboration.
- Tightly collaborating with TransPAC.
- Having meetings twice a year.

PRAGMA

Architecture, technology

◆ Based on GT2

- Allow multiple CAs
- Build MDS Tree

◆ Grid middleware/tools from Asia Pacific

- Ninf-G (GridRPC programming)
- Nimrod-G (parametric modeling system)
- SCMSWeb (resource monitoring)
- Grid Data Farm (Grid File System), etc.

Status

- ◆ 26 organizations (10 countries)
- ◆ 27 clusters (1674 CPUs)

Users, Applications and Experiences

● Users

- ▶ Participants of both/either ApGrid and/or PRAGMA

● Applications

- ▶ Scientific Computing

- ◉ Quantum Chemistry, Molecular Energy Calculations, Astronomy, Climate Simulation, Molecular Biology, Structural Biology, Ecology and Environment, SARS Grid, Neuroscience, Tele Science, ...

● Experiences

- ▶ Successful resource sharing between more than 25 sites in the application level.
- ▶ Lessons Learned
 - ◉ We have to pay much efforts for initiation
 - ✦ Installation of GT2/JobManager, CA, firewall, etc.
 - ◉ Difficulties caused by the bottom-up approach
 - ✦ Resources are not dedicated
 - ✦ Incompatibility between different version of software
 - ◉ Performance problems
 - ✦ MDS, etc.
 - ◉ Instability of resources

An experiment using Grid-enabled climate simulation

- Climate simulation is used as a test application to evaluate progress of resource sharing between institutions
- Climate simulation is developed using GridRPC system called Ninf-G
 - ▶ Ninf-G is developed using Globus C and Java API.
 - ▶ Layered in the same level of MPICH-G2
- We can confirm achievements of
 - ▶ Globus-level resource sharing
 - ⊗ Globus is correctly installed
 - ⊗ Queuing systems/job-manager work well
 - ⊗ Mutual authentication based on GSI
 - ▶ Application-level resource sharing
 - ⊗ Network configuration of the cluster
(note that most clusters use private IP addresses for backend nodes)

Necessary steps for the deployment

- Apply my account to each site
- Asked to add my entry to grid-mapfile
- Test globusrun
 - ▶ authentication
 - ⊗ Is my CA trusted? Do I trust your CA?
 - ⊗ Is my entry in grid-mapfile?
 - ▶ DNS lookup
 - ⊗ reverse lookup is used for server authentication
 - ▶ firewall / TCP Wrapper
 - ⊗ Can I connect to the Globus gatekeeper?
 - ⊗ Can the globus jobmanager connect to my machine?
 - ▶ jobmanager
 - ⊗ Is the queuing system (eg. pbs, sge) installed correctly?
 - ⊗ Does jobmanager script work as expected?
- In case of TeraGrid
 - ▶ Obtained my user certificate from TeraGrid CA (NCSA CA)
 - ▶ Asked IIT-ECHE and KISTI to trust NCSA CA
 - ▶ It was not possible to ask TeraGrid to trust AIST CTDC CA

Asia-Pacific Grid

Necessary steps for the deployment (cont'd)

● Install Ninf-G2

- ▶ Two frequently occurred problems due to inappropriate installation of GT2 SDK
 - ⌚ All SDK libraries are expected to be built from source bundles
 - ⌚ All SDK libraries are expected to be built using the same flavor
- ▶ If SDK is built from binary bundles, we need to ask rebuild SDK from source bundles
- ▶ Sample build flavor in GT2 manual:
 - ⌚ GRAM and DATA: gcc32dbg
 - ⌚ INFO: gcc32dbgpthr
- ▶ Need to ask additional installation of INFO SDK with gcc32dbg
 - ⌚ For GT2: simply run gpt-build for INFO SDK bundle with gcc32dbg
 - ⌚ For GT3.0: need to modify install-gt3 script
 - ⌚ For GT3.2: no smart solution ☹

Necessary steps for the deployment (cont'd)

Install and test the climate simulation

- ▶ Can Ninf-G server program connect to the client?
- ▶ If private IP addresses are used for backend nodes, NAT must be available
- ▶ Does the application run correctly?

Lessons Learned

● We have to pay much efforts for initiation

▶ Troubles in installation of GT2/PBS/jobmanger-pbs

Ⓢ Firewall?

Ⓢ Possible reasons for authentication error

- ⊛ CA Cert is not placed in /etc/grid-security
- ⊛ My entry is not appeared in grid-mapfile
- ⊛ Reverse lookup failed or the returned hostname does not match to the hostname in hostcert
 - Add host entries in /etc/hosts in our resources
- ⊛ Time is not synchronized between a client and a server
 - Change configuration of the system to refer a NTP server
- ⊛ CRL is expired

Ⓢ Possible reasons for errors in PBS

- ⊛ failed in rsh/ssh from/to server to/from backend nodes
 - .rhosts, ssh key, mismatch of hostname

Lessons Learned (cont'd)

🌐 MDS is not scalable and still unstable

▶ Performance is not good

🕒 GIIS lookup takes several ten seconds ~ minutes

▶ Some parameters in `grid-info-slapd.conf` such as `sizelimit`, `timeout`, `cahcettl`, etc., should be set to appropriate values depends on your environment (number of registered objects, network performance between GRISes and GIISes, etc.).

Lessons Learned (cont'd)

● Difficulties caused by the grass-roots approach.

- ▶ It is not easy to keep the GT2 version coherent between sites.

- ⊙ Some sites are still using GT2.0 since their application is built on the old version of CoG.

- ⊙ It is not easy to catch up frequent version up of the Globus Toolkit.

- ▶ Most resources are not dedicated to the ApGrid Testbed. (though this is a common problem for Grids)

- ⊙ There may be busy resources

- ⊙ Need grid level scheduler, fancy Grid reservation system?

Lessons Learned (cont'd)

● Requirements depend on the middleware and application

▶ For Ninf-G2

- @GT2 SDK must be built from source bundles
- @GT2 SDK must be built using the same flavor
- @NAT must be available for private IP address nodes

▶ For other Ninf-G2 applications

- @Intel Fortran Compiler is necessary
- @GAMESS or Gaussian is necessary

▶ In addition to the common software stack, we need to install software according to the requirements by the application

Grid
Technology
Research
Center
AIST

Asia-Pacific Grid

Lessons Learned (cont'd)

The testbed was unstable

- ▶ Unstable / poor network
- ▶ System maintenance (incl. version up of software) without notification
 - Ⓢ realized when the application would fail.
 - Ⓢ it worked well yesterday, but I'm not sure whether it works today
- ▶ Grid middleware should take care of this instability.

Observations

● Still being a “grass roots” organization

▶ Less administrative formality

Ⓢ cf. PRAGMA, APAN, APEC/TEL, etc.

Ⓢ Difficulty in establishing collaboration with others

▶ Unclear membership rules

Ⓢ Join/leave, membership levels

Ⓢ Rights/Obligations

▶ Vague mission, but already collected (potentially) large computing resources

Observations (cont'd)

● Duplication of efforts on “similar” activities

▶ Organization-wise

- ⌚ APAN - participation by country

- ⌚ PRAGMA – most organizations are overlapped

▶ Operation-wise

- ⌚ ApGrid testbed vs PRAGMA-resource

 - ⌚ may cause confusion

 - ⌚ technically, the same approach

- ⌚ Multi-grid federation

▶ Network-wise

Observations (cont'd)

● Two severe problems

▶ Lack of human resources

⌚ Few person must take care of everything

⌚ Cluster management, GT2 installation, software development, research...

⌚ Nobody is dedicated on this efforts (ApGrid)

▶ Have interests, but less motivation for doing hard work

⌚ Everybody is interested in Grid, but Grid is still difficult to use

⌚ How can I develop Grid-enabled application?

⌚ ~~Is it easy to make my application Grid-enabled?~~

Summary of current status

- Difficulties are caused by not technical problems but sociological/political problems
- Each site has its own policy
 - ▶ account management
 - ▶ firewalls
 - ▶ trusted CAs
 - ▶ ...
- Differences in interests
 - ▶ Application, middleware, networking, etc.
- Differences in culture, language, etc.

Grid
Technology
Research
Center
AIST

Asia-Pacific Grid

▶ Human interaction is very important

AIST

Summary of current status (cont'd)

● What has been done?

- ▶ Resource sharing between 26 sites (1674cpus are used by Ninf-G application)
- ▶ Use GT2 as a common software

● What hasn't?

- ▶ Formalize “how to use the Grid Testbed”
 - ⊙ I could use, but it is difficult for others
 - ⊕ I was given an account at each site by personal communication
 - ⊙ Provide documentation
- ▶ Keep the testbed stable
- ▶ Build an environment for helping users
 - ⊙ helpdesk
 - ⊙ training

What's the role of ApGrid?

- Deploy middleware on all institutions to support easy implementation of resource sharing and development/execution of Grid applications
 - ▶ Define minimum requirements for middleware
 - ▶ Define recommended configuration of the middleware
- Keep the testbed as stable as possible
- Define and authorize security policy in Asia Pacific.
- Collaboration with PRAGMA and APAN is definitely necessary for tackling with these

Grid
Technology
Center
AIST

Asia-Pacific Grid

Towards a production Grid

- Grid technology is still too difficult to use.
- In order to solve this problem, ApGrid, PRAGMA, and APAN will collaborate on the following activities:

- ▶ publishing Grid documents
- ▶ running the production grid
- ▶ support for Applications
- ▶ organizing meetings
- ▶ building knowledge center

▶ running Asia Pacific Grid PMA

Grid
Technology
Research
Center
AIST

Summary

- It is tough work to make resources available for applications
 - ▶ many steps
- It is tough to keep the testbed stable
- Many issues to be solved toward a production Grid
 - ▶ Technical
 - ⊗ local and global scheduler
 - ⊗ dedication / reservation / co-allocation
 - ▶ Political
 - ⊗ CA policy
 - ⊗ How can I get an account on your site?
 - ▶ Both
 - ⊗ Coordination of middlewares

● Tight collaboration between ApGrid, PRAGMA, and
APAN is definitely necessary for running production Grid in Asia-Pacific
